Hands-on lab on Hadoop Map-Reduce (20 mins)

Objectives

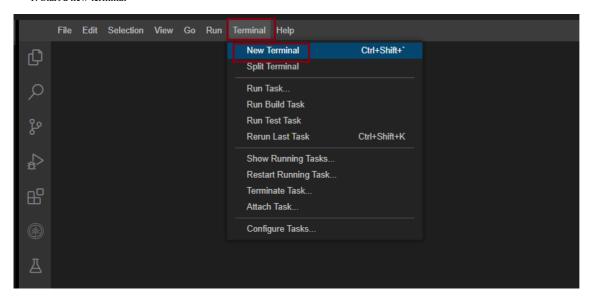

- Run a single-node Hadoop instance
- Perform a word count using Hadoop Map Reduce.

Set up Single-Node Hadoop

The steps outlined in this lab use the single-node Hadoop Version 3.3.6 **Hadoop** is most useful when deployed in a fully distributed mode on a large cluster of networked servers sharing a large volume of data. However, for basic understanding, we will configure Hadoop on a single node.

In this lab, we will run the WordCount example with an input text and see how the content of the input file is processed by WordCount.

1. Start a new terminal

- 2. Download hadoop-3.2.3.tar.gz to your theia environment by running the following command.
- 1. 1
- $1. \ \ curl \ https://dlcdn.apache.org/hadoop/common/hadoop-3.3.6/hadoop-3.3.6.tar.gz \ --output \ hadoop-3.3.6.tar.gz \ --output \ --output$

Copied! Executed!

- 3. Extract the tar file in the currently directory.
- 1. 1
- 1. tar -xvf hadoop-3.3.6.tar.gz

Copied! Executed!

- 4. Navigate to the hadoop-3.3.6 directory.
- 1. 1
- 1. cd hadoop-3.3.6

Copied! Executed!

- 5. Check the hadoop command to see if it is setup. This will display the usage documentation for the hadoop script.
- 1. 1
- 1. bin/hadoop

Copied! Executed!

- 6. Run the following command to download data.txt to your current directory.
- 1. 1
- 1. curl https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBM-BD0225EN-SkillsNetwork/labs/data/data.txt --output data.txt

Copied! Executed!

- 7. Run the Map reduce application for wordcount on data.txt and store the output in /user/root/output
- 1. 1

1. bin/hadoop jar share/hadoop/mapreduce/hadoop-mapreduce-examples-3.3.6.jar wordcount data.txt output

Copied! Executed!

This may take some time.

- 8. Once the word count runs successfully, you can run the following command to see the output file it has generated.
- 1. 1
- 1. ls output

Copied! Executed!

You should see part-r-00000 with _SUCCESS indicating that the wordcount has been done.

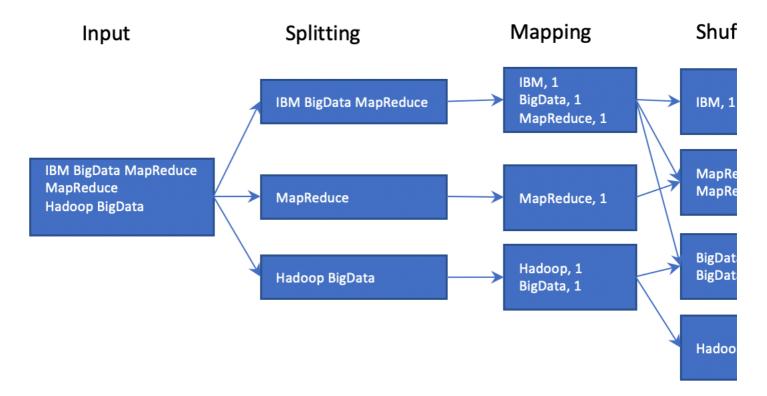

While it is still processing, you may only see 'temporary' listed in the output directory. Wait for a couple of minutes and run the command again till you see output as shown above.

- 9. Run the following command to see the word count output.
- 1. cat output/part-r-00000

Copied! Executed!

The image below shows how the MapReduce wordcount happens.

Practice Lab

- 1. Do a word count on a file with the following content.

- Italy Venice
 Italy Pizza
- 3. Pizza Pasta Gelato

Copied!

▼ Click here for a hint on how to get started

- Delete the data.txt file and output folder
 - 1. 1
 - 1. rm data.txt

Copied!

- 1. 1
- 1. rm -rf output

Copied!

▼ Click here for hint on how to create a file to wordcount

Create data.txt with the required content. You may either use the file editor.

▼ Click here for solution on how to do word count on the file

Run the following command

- 1.
- 1. bin/hadoop jar share/hadoop/mapreduce/hadoop-mapreduce-examples-3.3.6.jar wordcount data.txt output

Copied!

▼ Click here for sample output

The output will be as below.

```
root@e4d298bfe26c:/# hdfs dfs -cat /user/root/output/part-r-00000
2021-07-13 05:21:45,467 INFO sasl.SaslDataTransferClient: SASL enc
sted = false
Gelato 1
Italy 2
Pasta 1
Pizza 2
Venice 1
```

Congratulations! You have:

- Deployed Hadoop using Docker
- · Copied data into HDFS
- Used MapReduce to do a word count
