

Module 2 Cheat Sheet: Introduction to the Hadoop Ecosystem

Package/Method	Description	Code Example
bin/hadoop	All Hadoop commands are invoked by the bin/hadoop script. Running the Hadoop script without any arguments prints the description for all commands.	Running Hadoop script without arguments: 1. 1 1. bin/hadoop Copied!
cat	Reads each file parameter in sequence and writes it to standard output. If you do not specify a file name, the cat command reads from standard input. You can also specify a file name of - (dash) for standard input.	<pre>1. 1 2. 2 1. echo "This is file 1" > file1.txt 2. echo "This is file 2" > file2.txt Copied! Use the cat command to read and display the contents of both files 1. 1 1. cat file1.txt file2.txt Copied! Sample output (Contents of file1.txt and file2.txt): 1. 1 2. 2 1. This is file 1 2. This is file 2 Copied!</pre>
cd	Used to move efficiently from the existing working directory to different directories on your system.	Basic syntax of cd command: 1. 1 1. cd [options] [directory] Copied!

Example 2: Get back to the previous working directory

- 1. 1
- 1. cd -

Copied!

Example 3: Move up one level from the present working directory tree

- 1. 1
- 1. cd ..

Copied!

create table

Used to create a new table in a database

Used to create Create a new database (if not already created).

- 1. 1
- CREATE DATABASE your_database;

Copied!

Use the newly created database.

- 1. 1
- USE your_database;

Copied!

Create a new table named "employees" in Hive.

- 1. 1
- 2. 2
- 3. 3
- 4. 4
- 5.5
- 6. 67. 7
- 8. 8
- 9.9
- 10. 10
- CREATE TABLE employees (
 id INT,
- first_name STRING,
- last_name STRING,
- email STRING,
- 6. hire_date DATE
- 7.)
- 8. ROW FORMAT DELIMITED
- 9. FIELDS TERMINATED BY ','
- 10. STORED AS TEXTFILE;

Copied!

Show the list of tables in the database.

- 1. 1
- 1. SHOW TABLES;

Copied!

Sample Output (List of Tables):

- 1. 1
- 2. 2

Package/Method Description

Code Example

- 1. OK
- 2. employees

Copied!

A commandline tool (pronounced "curl") that allows data to be exchanged

1. 1

between a

curl https://www.example.com

device and a server through Copied!

a terminal.

In this example, we use the curl command to send a GET request to https://www.example.com and display the HTML response from the server.

Example 1: Sending a GET request and displaying the response

Send a GET request to a server and display the response.

The user specifies the

server URL, the location

Example 2: Sending data to a server using POST Request:

where they want to send the request,

Send a POST request with data to a server and display the response.

and the data

1. 1

they want to send to the

curl -X POST -d "name=John&age=30" https://www.example.com/api

server URL using this

(CLI).

Copied!

command-line In this example, we use the curl command to send a POST request to interface

https://www.example.com/api with data name=John&age=30 and display the JSON response from the server.

docker exec Runs a new

curl

command in a

Running a command in a running Docker container:

running

Run a new command inside a running Docker container.

container. It only runs

1. 1

when the

docker exec -it container name or id ls /app

container's primary

Copied!

process is

running, and it Sample Output (List of files in the '/app' Directory inside the container):

is not restarted

if the

1. 1

container is restarted.

2. 2 3. 3

1. file1.txt 2. file2.txt

3. subdirectory

Copied!

In this example:

- docker exec is used to run a new command (1s /app) inside a running Docker container.
- -it enables an interactive terminal session, which allows you to see the output of the command.
- container_name_or_id is the name or ID of the running Docker container you want to execute the command in.

Package/Method Description

Code Example

• 1s /app is the command that lists the files and directories in the '/app' directory inside the container.

Starting Docker containers using docker-compose:

Suppose you have a docker-compose.yml file like this:

```
1. 1
2. 2
3. 3
4. 4
5.5
6.6
7. 7
8.8
9.9
```

Compose is a

tool for

defining and running multicontainer Docker

applications. It uses the

YAML file to configure the services and enables us to create and

start all the just one configuration file.

10. 10

1. version: '3' services: 2. 3. web:

4. image: nginx:latest 5. ports: - "80:80" 6. 7.

8. image: postgres:latest 9. environment: 10. POSTGRES_PASSWORD: example_password

Copied!

You can use docker-compose to start the services defined in the dockerservices from compose.yml file as follows:

Navigate to the directory containing the docker-compose.yml file.

1. 1

cd /path/to/your/docker-compose-project

docker pull [OPTIONS] IMAGE_NAME[:TAG]

Copied!

Start the Docker containers defined in the docker-compose.yml file

1. 1

1. docker-compose up

Copied!

You can download

1. 1

Docker images from

Copied!

the internet. It runs a command in a

new container,

1. 1

getting the docker run image and

Copied!

starting the container if needed.

You can create

a copy of a specific

1. 1

1. git clone REPOSITORY_URL [DESTINATION_DIRECTORY]

docker run [OPTIONS] IMAGE [COMMAND] [ARG...]

docker pull

docker-compose

git clone

```
Package/Method Description
                                                                Code Example
                 repository or
                                  Copied!
                 branch within
                 a repository.
                                Example-1:
                                Listing files and directories in HDFS:
                  Apache
                 Hadoop
                                List files and directories in the root directory of HDFS.
                 hadoop fs or
                 hdfs dfs are
                                   1. 1
                 file system
                                   1. hdfs dfs -ls /
                  commands to
                 interact with
                                 Copied!
                 HDFS. These
                 commands are
                                Example-2: In this example, we use the hdfs dfs -1s command to list files and
                  very similar to
                                directories in the root directory of HDFS.
                  Unix
                  commands.
                 Hadoop
                 provides two
                                   1. hdfs dfs -ls /
                 types of
                                  Copied!
hdfs dfs
                  commands to
                  interact with
                                Sample output:
                 the file
                  system:
                                   1. 1
                 hadoop fs or
                                   2. 2
                 hdfs dfs. The
                                   3. 3
                 major
                                                    - hdfs hduser
                                                                             0 2023-09-13 10:00 /user
                                   1. drwxr-xr-x
                 difference is
                                   2. drwxrwxrwx
                                                    - hdfs hduser
                                                                             0 2023-09-13 10:05 /tmp
                 that Hadoop
                                   3. drwxrwxrwx
                                                    - mapred hduser
                                                                            0 2023-09-13 10:10 /mapred
                 commands are
                  supported
                                 Copied!
                  with multiple
                  file systems
                                Create a new directory named "mydata" in HDFS.
                 like S3, Azure,
                  and many
                                   1. 1
                 more.
                                   1. hdfs dfs -mkdir /user/your username/mydata
                                  Copied!
                                Display the contents of a file in HDFS.
                  Display the
                                   1. 1
hdfs dfs -cat
                  contents for a

    hdfs dfs -cat /path/to/file.txt

                  file.
                                 Copied!
                                Create a directory in HDFS.
                  Creates a
                                   1. 1
                  directory
hdfs dfs -mkdir
                 named path in

    hdfs dfs -mkdir /user/username/mydirectory

                 HDFS
                                 Copied!
                                 Upload a file from the local file system to HDFS.
                  Upload a file
                                   1. 1
                  or folder from
hdfs dfs -put
                 the local disk

    hdfs dfs -put localfile.txt /user/username/hdfsfile.txt

                 to HDFS.
                                  Copied!
```

```
Package/Method Description
                                                                 Code Example
                  Hive provides
                  the
                  functionality
                  to load
                                 Load data from HDFS into a Hive table.
                  precreated
                  table entities
                                    1. 1
                  either from the
                                    2. 2
LOAD DATA
                  local file
INPATH
                                    1. LOAD DATA INPATH '/user/username/hdfsfile.txt' INTO TABLE
                  system or
                                    mytable;
                  from HDFS.
                  This
                                  Copied!
                  command is
                  used to load
                  data into the
                  hive table.
                  Writes to
                                 Basic command syntax
                  standard
                  output the
                                    1. 1
                  contents of

    ls [options] [file/directory]

                  each specified
                  Directory
                                  Copied!
                  parameter or
                  the name of
                                 Example 1: Sorts the file names displayed in the order of last modification time.
                  each specified
                                 'r' is for displaying in reverse order
                  file parameter,
                  along with any
                                    1. 1
                  other
                                    2. 2
ls
                  information
                                    1. ls -lt
                  you ask for
                                    2. ls -ltr
                  with the flags.
                  If you do not
                                  Copied!
                  specify a file
                  or directory
                                 Example 2: Displays hidden files
                  parameter, the
                  ls command
                                    1. 1
                  displays the
                                    1. ls -a
                  contents of the
                  current
                                  Copied!
                  directory.
                  Used to create
                  one or more
                  directories
                  specified by
                  the Directory
                  parameter.
                  Each new
                                 Create a new directory named "myfolder."
                  directory
                  contains the
mkdir
                  standard
                                    1. mkdir myfolder
                  entries dot (.)
                  and dot dot
                                  Copied!
                  (..). You can
                  specify the
                  permissions
                  for the new
                  directories
                  with the -m
```

Mode flag.

Code Example Package/Method Description Select all rows from a table. Lists all the rows from the 1. 1 table to check SELECT * if the data has **FROM** SELECT * FROM tablename; been loaded from the file. Copied! Show all tables in the selected database. Used to see all the tables in show tables the database 1. SHOW TABLES; that have been selected. Copied!
